How Should We Map Atlanta's Housing Affordability?

Project Aim: *Develop a predictive model that maps the affordability of housing units across the whole Atlanta region*

Modeling Strategy: Build a predictive model utilizing the Low-Income Housing Tax Credit (LIHTC) index to forecast rental price/affordability across different geographic regions.

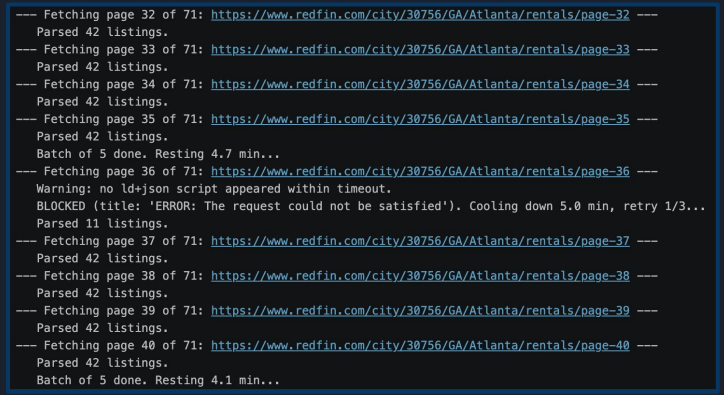

Data Sources: LIHTC index, Redfin Atlanta Area Rental Prices

Potential Data Sources: HUD 2026 Small Area Fair Markent Rents mapped by specific zip codes, Federal Reserve Bank of Atlanta's Southeastern Rental Affordability Tracker, City of Atlanta GIS Shapefiles

Next steps:

- Explore other potential data to find reliable sources for income/affordability
- Link our LIHTC score to individual properties
- Develop a model that predicts rental prices based on LIHTC score
- Create visualization tools that outputs our results

Current Progress: Developed a web-scraping tool that allows us to get the rental prices of properties listed on Redfin in Atlanta

***The web-scraping tool currently takes a long time (165 mins) to parse through all the data, optimization needed**
